

# Morita CBCT Imaging

## Superior Quality & Maximum Patient Safety

Our goal is to provide you with the best, most accurate, and thorough diagnosis possible. Recent technological breakthroughs have allowed us to make major advances in our ability to achieve that goal. CBCT (Cone Beam Computed Tomography), also referred to as 3D, is a new technology similar to CAT scans in that it will give us a 360 degree three dimensional view of the area we are examining.

Previously, we were limited to a two dimensional picture of a three dimensional problem. There were many things we could not see because dental X-rays did not have the resolution to show them. Despite our best efforts, we were forced to infer, project, surmise, calculate, and interpret. Often, we could only give our best educated guess based on what we could see on the X-ray. Additionally, X-rays were often just not sensitive enough to show very small or the beginning signs of problems.

That has all changed significantly with the advent of CBCT. With its extremely high resolution and exceptionally low radiation, it has literally changed our world with respect to what we can now see. CBCT imaging offers a large volume of information and subtle details that simply cannot be obtained by any two dimensional X-ray, whether intraoral or panoramic. One 3D scan will allow us to examine the region of interest at a high resolution from many different perspectives. Clinical studies support this technology's improved diagnostic capabilities. We are very proud of CBCT and feel strongly that this state-of-the-art technology will allow us to provide our patients with the very highest level of care possible today.

*Reuleaux Full Arch field of view, indicated in yellow, is a new Morita technology that can reduce radiation exposure up to 40%.*

Veraviewepocs 3D R100 is the latest addition to J. Morita's 3D product line. This unit's completely unique 3D Reuleaux Full Arch FOV (field of view) abandons the typical cylinder with a new convex triangle shape. By more closely matching the natural dental arch form, this groundbreaking FOV reduces dose by excluding areas outside the region of interest and allows a complete scan of the maxilla and/or the mandible in 20 seconds or less.

Dose reduction mode lowers exposure for vital organs which reduces dosage to a mere 60% of the standard mode. The Morita machines offer extremely low radiation dose. Below are a few comparisons for a typical 100 x 80 FOV scan:

- Less than a medical chest x-ray
- Less than the amount of radiation absorbed during a flight from New York to Asia

We look forward to providing you with exceptional care utilizing the most current and advanced technology available in dentistry.

*Reference: Effective dose is calculated in accordance with the ICRP 2007 Draft for exposure of the Mandibular Molar Region with Morita's recommended loading factor (90kV, 3mA, 9.4sec., Ø 100 x H 80 mm). Comparison using the Veraviewepocs 3D R100.*

Thinking ahead. Focused on life.
