

# Cephalometric Imaging

## High Speed

The Veraviewepocs system offers high speed performance requiring only 2.6 to 5.8 seconds for a lateral projection. The speed helps ensure high quality images each and every time. For pediatric patients, the reduced scan time is especially helpful as repeat images due to patient movement are virtually eliminated.

## Low Dose

With only a tenth of the dose compared to a conventional X-ray\*, the exposure level is significantly reduced.

## High Quality Image with Wide Dynamic Range

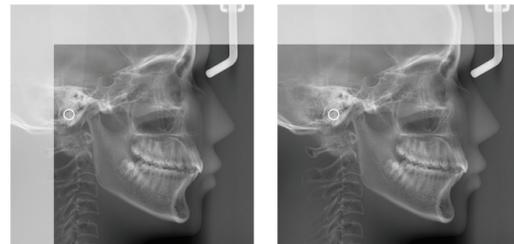

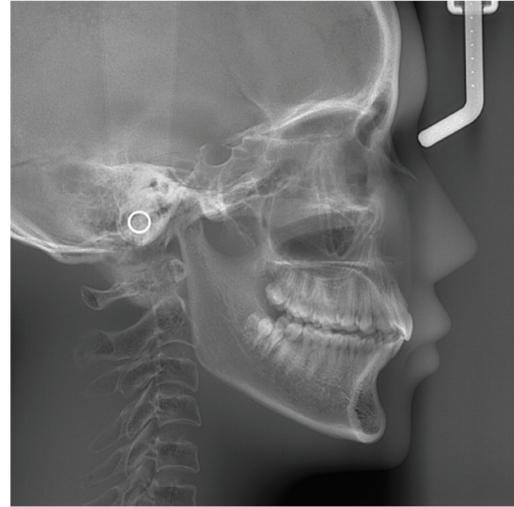

You obtain far more information about hard and soft tissue – with just a single acquisition.

## Variable Imaging Processing

The variable image processing technique generates optimum grayscale values by varying scanning speeds for hard and soft tissue.

## Processing Time

On average, image processing is completed within just 20 seconds.

## Partial Cephalometric Images

If not needed for examination, X-ray dose can be reduced by eliminating the area behind the auditory canal. There are 3 partial image patterns.

## Veraviewepocs 3D R100 & F40

Innovative 3D Reuleaux Full Arch FOV

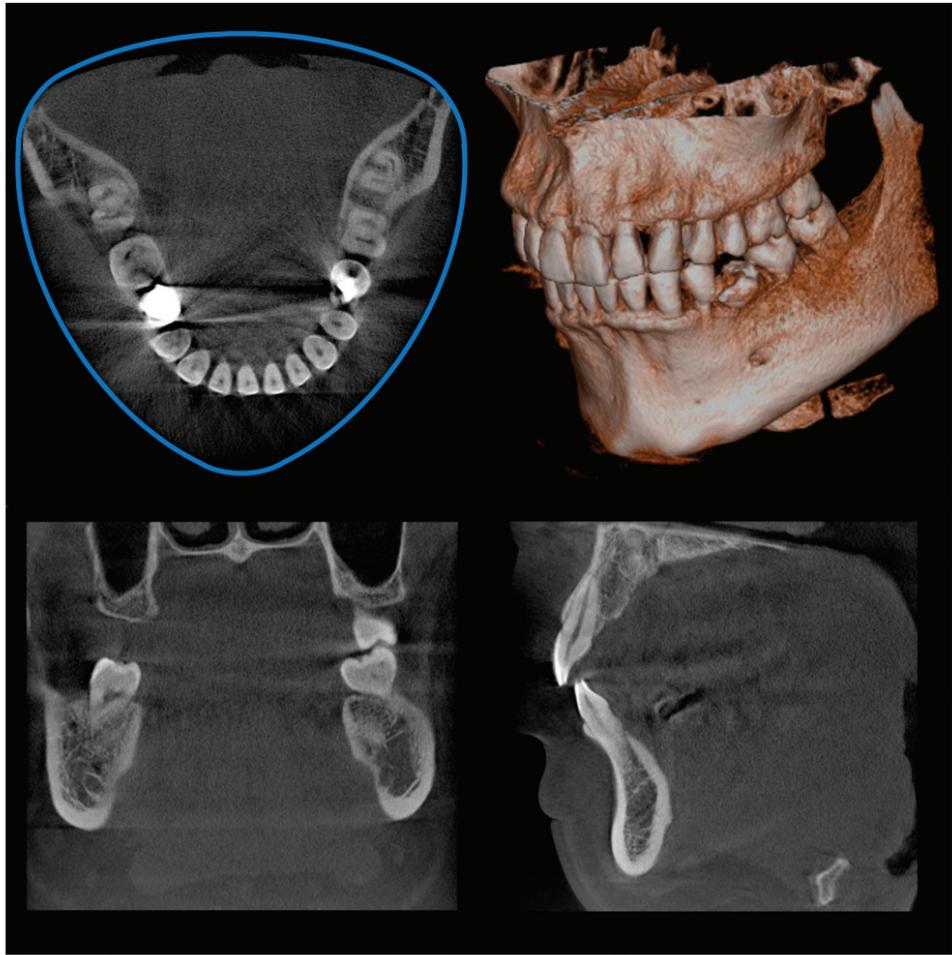

Thinking ahead. Focused on life.

\* Comparison made to Veraviewepocs film-based system

# 3D Reuleaux Full Arch Field of View

Blue line indicates new full arch FOV, equivalent to Ø100 mm.

### New Patent Pending Technology

Morita's new and completely unique 3D Reuleaux Full Arch FOV abandons the typical cylinder with a new convex triangle shape. By more closely matching the natural dental

arch form, this groundbreaking FOV reduces dose by excluding areas outside the region of interest and allows a complete scan of the maxilla and/or the mandible.

Not available on the Veraviewepocs 3D F40 model.

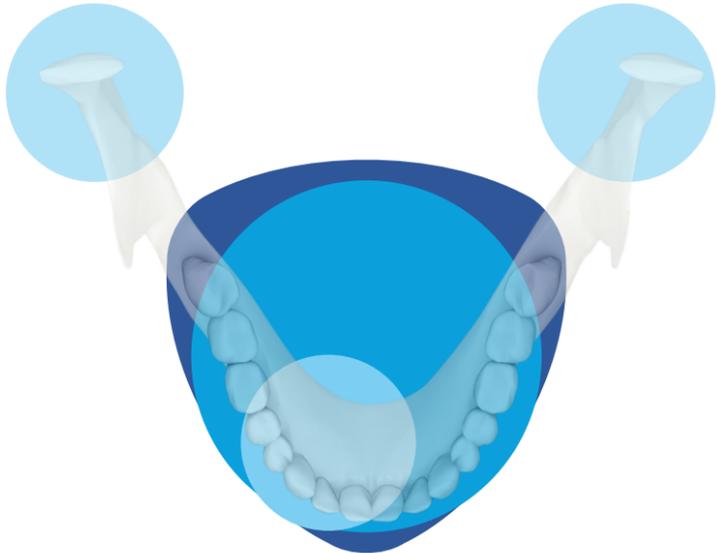

# Various Fields of View

### Exposure Areas for Multiple Diagnostics

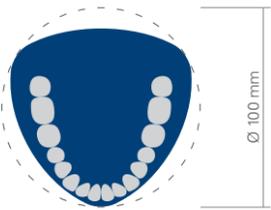

The Veraviewepocs 3D R100 model offers a total of 6 exposure areas from Ø 40 x H 40 mm up to Ø 100 x H 80 mm for various diagnostic needs.

The new full arch scan captures the maxilla and/or the mandible with the equivalent of 100 mm in diameter and two height options of 50 or 80 mm. Its full arch capability, reduced dose, and exceptional clarity are ideal features for implant planning and oral surgery. This unit also offers small and medium field of view sizes suitable for endodontics, periodontics, as well as general dentistry.

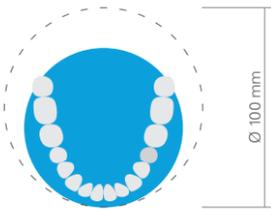

The Veraviewepocs 3D F40 model offers Ø 40 x H 80 mm and Ø 40 x H 40 mm fields of view, also suitable for a variety of applications.

\*3D Reuleaux Full Arch FOV

# High Resolution Images

## With Dose Reduction Feature

### Dose Reduction Feature

Through advanced engineering, a Dose Reduction Mode optimizes the intensity of the X-rays which lowers exposure for easily penetrated tissues. Dose is reduced to a mere 60% of the standard mode.\* By maximizing efficiency, the maxillary sinus membrane appears sharper than ever before with fewer artifacts.\*\*

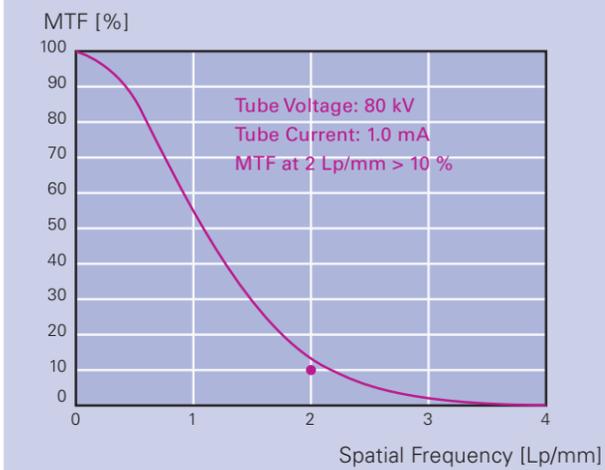

Ø 40 x H 80 mm high resolution image taken in Dose Reduction Mode

### Resolution & Clarity

Veraviewepocs offers high resolution images of 125 µm voxel. It provides clear images of the periodontal pocket, the periodontal ligament, and the alveolar bone. It is extremely useful for implant therapy from planning to post-operative observation.

### Spatial Resolution MTF: Modulation Transfer Function

### Super-High Resolution for All Image Areas

The resolution of Veraviewepocs is greater than 2 line pairs per mm (MTF 10%). The highly detailed images have a voxel size of 0.125 mm per side, and the slice thickness and interval can be set between 0.125 and 12.375 mm.

Note: The largest field of view of the Veraviewepocs 3D R100 model, Ø 100 mm (Equivalent) x H 80 mm, offers a voxel size of 0.16 mm.

\* For Ø 40 X H 80 mm exposures. \*\* Compared to standard exposure mode.

# Easy 3D Positioning

### Flexibility

Veraviewepocs offers flexibility in positioning methods. The region of interest can be positioned by the panoramic image, the bi-directional scout, or the 5 positioning laser beams.

### Panoramic Image with Scout Feature

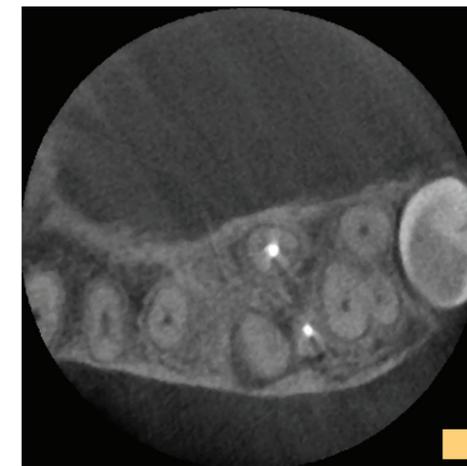

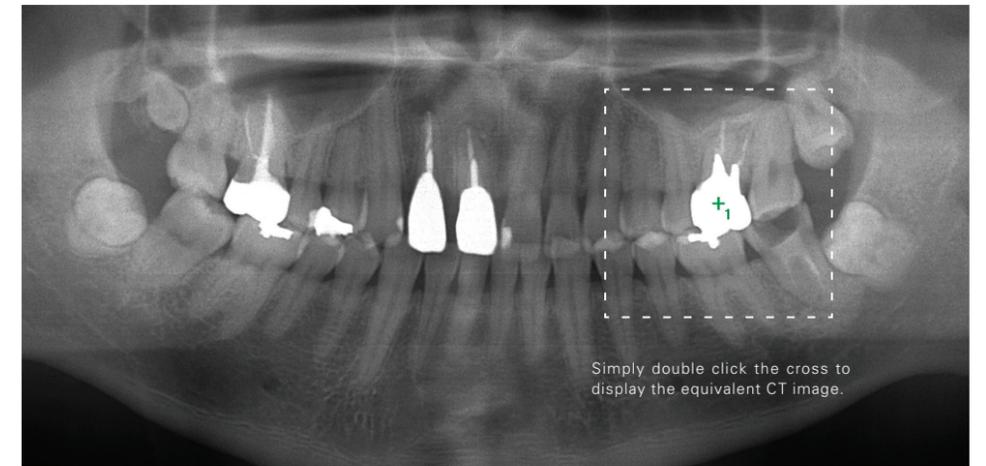

Before taking a 3D image, a high resolution panoramic exposure is taken to target the region of interest on the PC monitor. The C-arm will automatically move into the optimum patient position to get 3D images at the center of the region of interest.

### Bi-directional Scout

After initial positioning is accomplished by the 3 positioning laser beams, bi-directional X-ray images can be taken to confirm that the position is accurate. If it is not, simply adjust the position of the image on the computer by placing the cursor at the center of the region of interest.

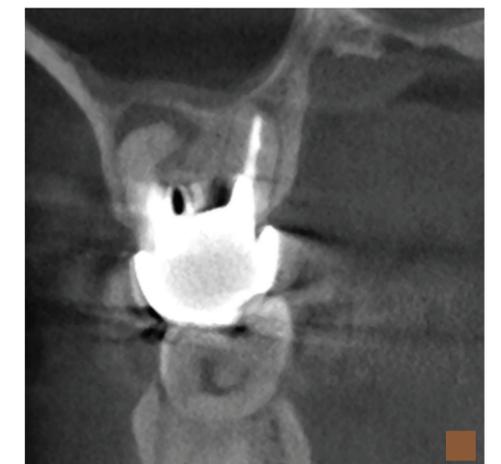

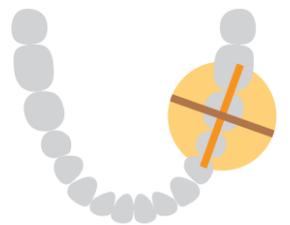

### Direct Positioning with 5 Laser Beams

5 positioning laser beams set the patient's position and align the region of interest. First, the patient's initial position is set using the 3 laser beams. Then, 2 additional laser beams are aligned to the region of interest. The C-arm will automatically move to the right position.

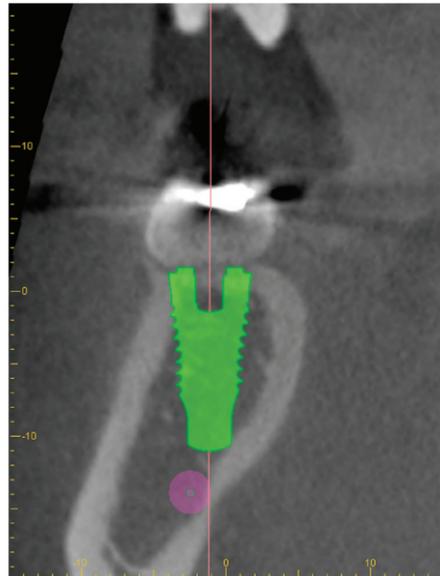

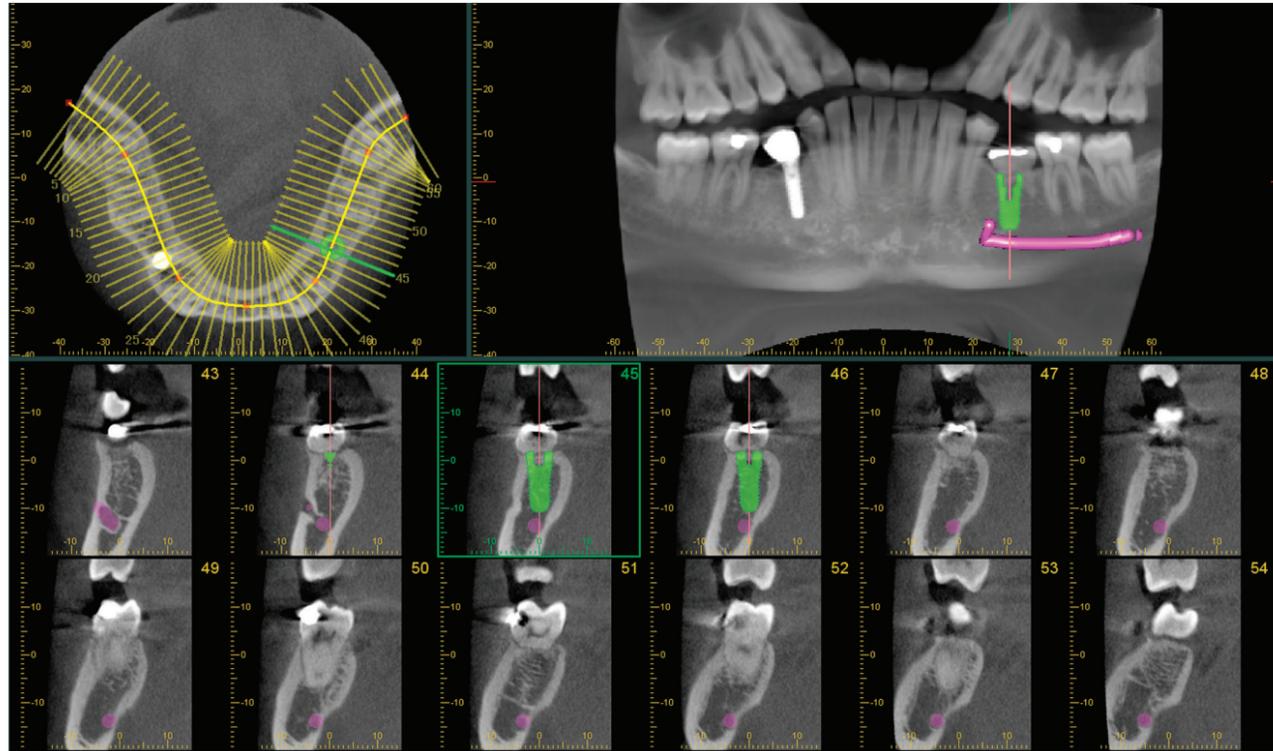

### Clinical Case Example

The panoramic image above suggests that there is an apical lesion on the distal root of tooth #26. Further inspection with a 3D image, however, shows that the lesion is on the buccal side of an extremely curved mesial root.

# 3D Images for Implant Planning

## Planning Process

Successful placement of implants starts with the very critical and detailed planning process. Identification of structures such as the sinus cavity, inferior alveolar nerve, and clear views of the bone structure are needed.

Veriviewepocs 3D R100 is ideal for implant planning with full arch imaging, industry leading clarity, and low dose to the patient.

## Software

i-Dixel 2.0 software offers advanced implant planning features, plus compatibility with popular third party software.

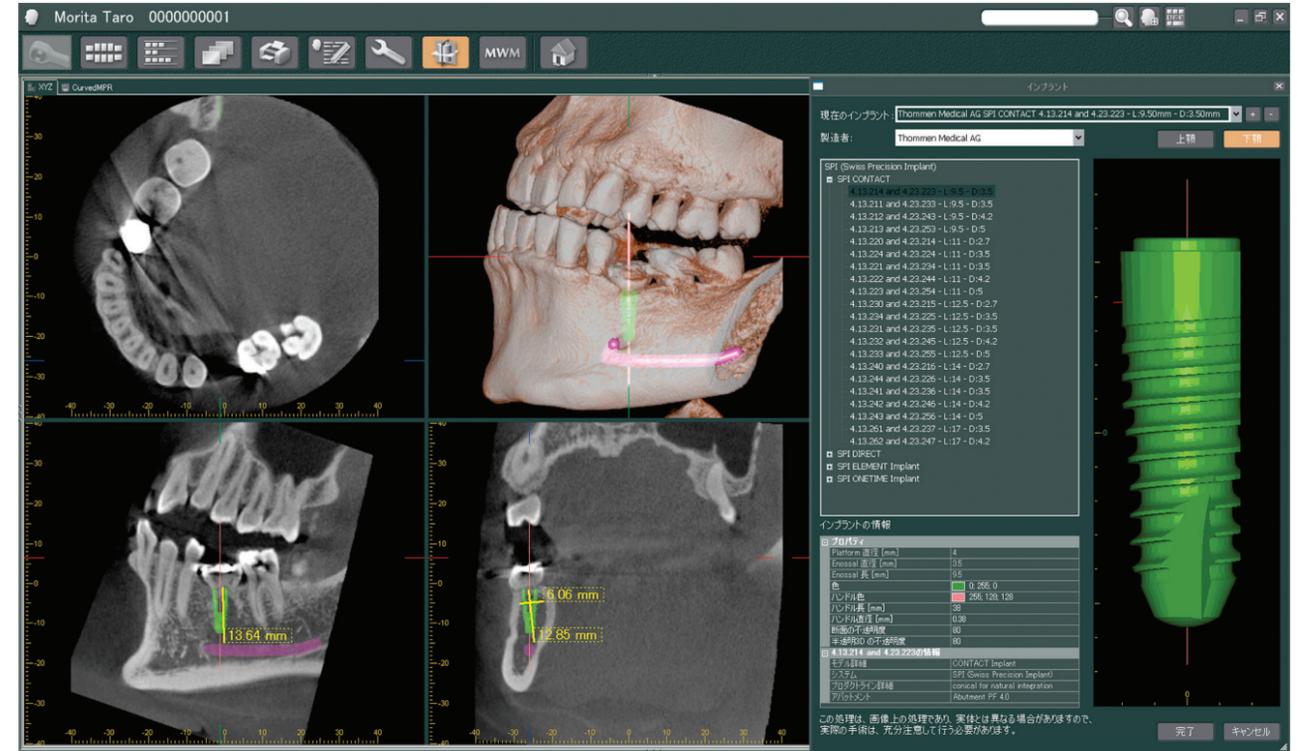

## cMPR Image Processing

Create cross sectional images of the dental arch.

## Mandibular Canal Tracing

Highlight the mandibular canal for easier viewing, measuring the distance to the implant and determining its buccal and lingual position.

# Advanced Software Features

## Confirm Implant Position with Volume Rendered Image

A high resolution volume rendered image of the entire jaw can be created. This rendering makes it easy to explain each step of the implant planning and treatment process to the patient.

## Implant Library

The implant library can be used to make realistic presentations for patients.

## Link to Implant Simulation Software

By converting images to DICOM formats, implant simulation can be performed with other third party software.

## Presentation Preparation

The data for implant devices including length and diameter can be used to superimpose an image of the device on a 3D image to show patients and others.

# Clinical Cases

## Implantology

The patient was seen for a routine follow up visit following implant placement of tooth #16. The implant had been placed 9 years earlier. The coronal, sagittal, and axial views all confirm good quality bone around the implant and an absence of any pathology related to the treatment. The fine detail of the bone, especially in the coronal view, allows the clinician and the patient to feel confident about the current health of the implant.

## Endodontics

The patient presented with a radiolucency around tooth #26 that had previously been treated endodontically. Conventional 2D imaging was inconclusive so a cone beam CT image was taken with the 3D R100. The sagittal and coronal views both showed that the endodontic therapy was failing and there were apical lesions on both the buccal and palatal roots.

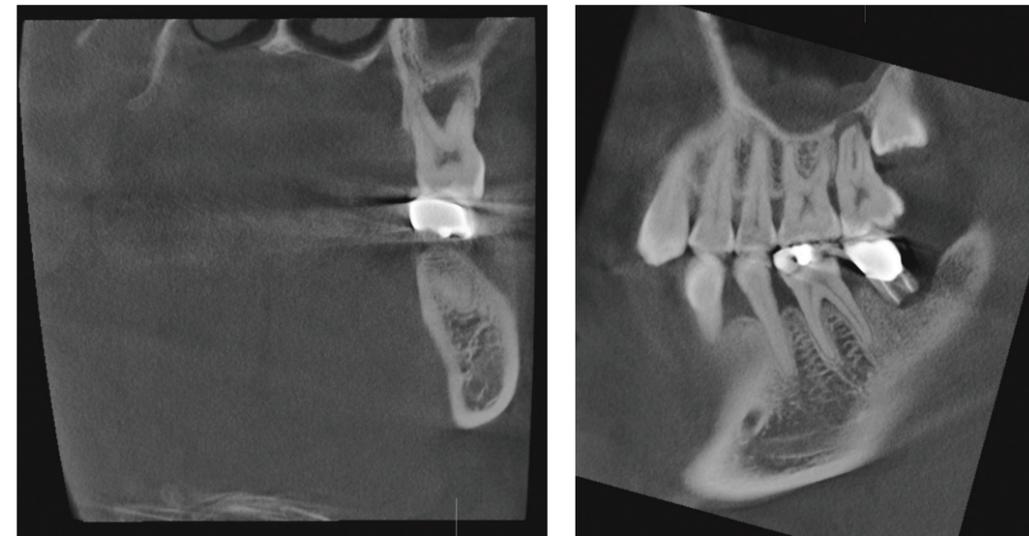

The sagittal view clearly confirms a perforation of the Schneiderian membrane, while the coronal view identifies odontogenic maxillary sinusitis and mucosal thickening. The damage to the sinus membrane may have been overlooked if this case was diagnosed and treatment planned with an image that did not show the problem so clearly.

## Oral Surgery

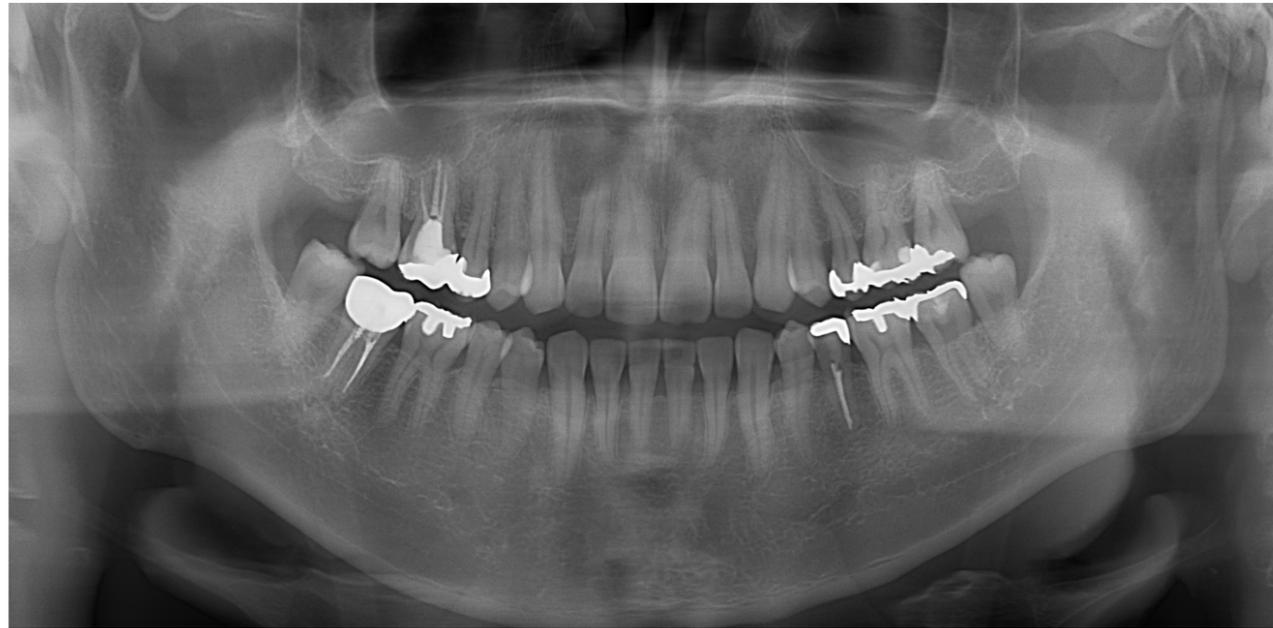

The patient presented with pain in the maxillary left region. A cone beam CT image was taken with the 3D R100 and it was revealed that tooth #28 was in fact impacted and was causing problems for tooth #27. The axial view demonstrated extensive bone loss near the apical area of #27 due to the lack of arch space needed for #28 to erupt.

The coronal view showed bone destruction all the way through the furcation of #27. The sagittal image not only shows the loss of osseous support around the entire apex of #27, but also shows damage to the sinus floor and mucosal thickening.

A portion of the clinical images were provided by Kitasenju Radist Dental Clinic, i-View Imaging Center, Japan.

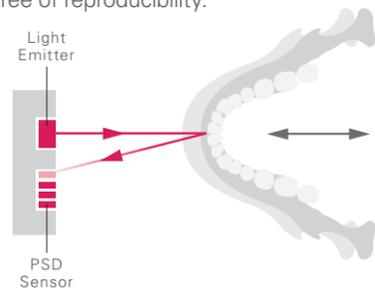

# Panoramic Imaging

After focal plane adjustment

## AF Automatic Positioning

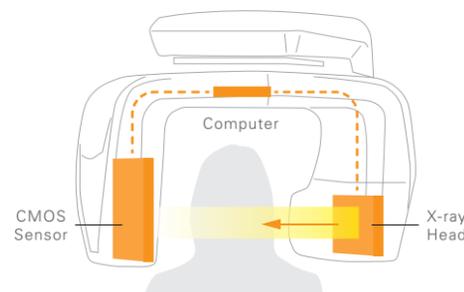

This function makes patient positioning nearly effortless. A light beam sensor automatically positions the unit without requiring the patient to move. The light beam sensor measures the distance to the patient's teeth, then the arm automatically moves into the optimal position. This process produces images with a high degree of reproducibility.

AF Automatic positioning Technology

## DDAE (Digital Direct Auto Exposure)

The DDAE function controls X-ray emission in real time depending on the area being examined and produces a wide dynamic range, as well as sharp and exceptionally clear images.

DDAE Mechanism

## AIE (Auto Image Enhancement)

This software processing function uses a logarithmic conversion to adjust the overall density and to highlight shaded details, creating a better image.

## Standard Panoramic

The X-Y movement and arm rotation are coordinated by a computer control system to create a projection with the optimum image layer shape.

## Orthogonal Panoramic

This projection controls the angle of X-ray penetration to reduce the overlapping of individual teeth.

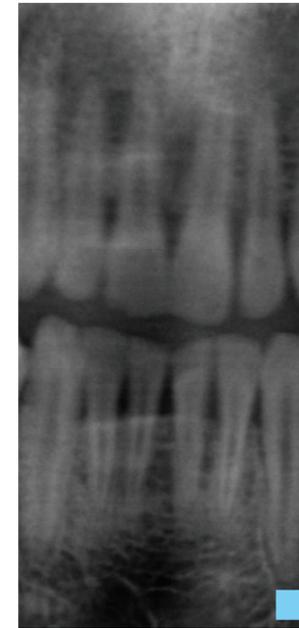

## Shadow Reduction Panoramic

This projection controls the angle of X-ray penetration to reduce the mandibular ramus shadow.

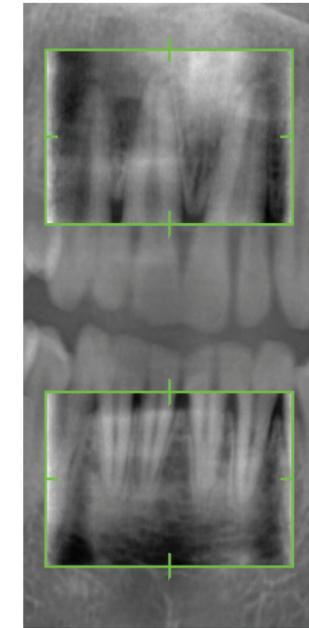

# Focal Plane Adjustment After Exposure

## Panoramic Focal Plane Adjustment

The focal plane for panoramic images can be adjusted after the exposure has been made to improve clarity and sharpness. The focus can be improved for points of varying depth as well as the surface. Select any point in the image for focus enhancement and then use the mouse wheel to make the adjustment.

Before focal plane adjustment

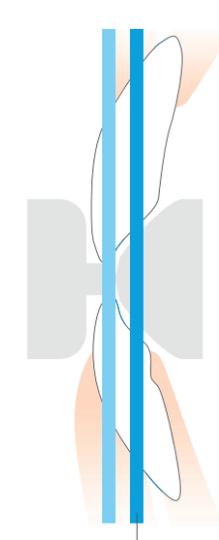

Preview images are shown in the green frame to support the manipulation of focal plane adjustment

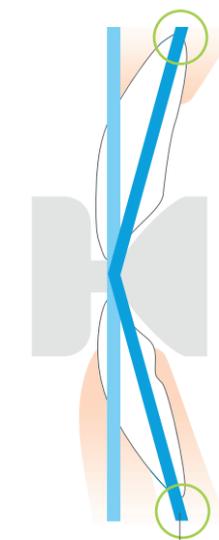

After focal plane adjustment

## Focal Plane Adjustment Options

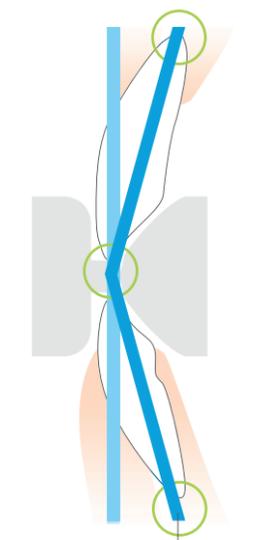

With various methods, the focal plane can be adjusted to obtain optimum image results.

Adjusted Focal Plane  
Single point adjustment – simply adjust the focal plane alignment to the posterior and anterior direction.

Adjusted Focal Plane  
Two points adjustment – the focal plane position of the apical region can be adjusted separately at the mandibular and the maxilla. The layer position at the occlusal plane is fixed.

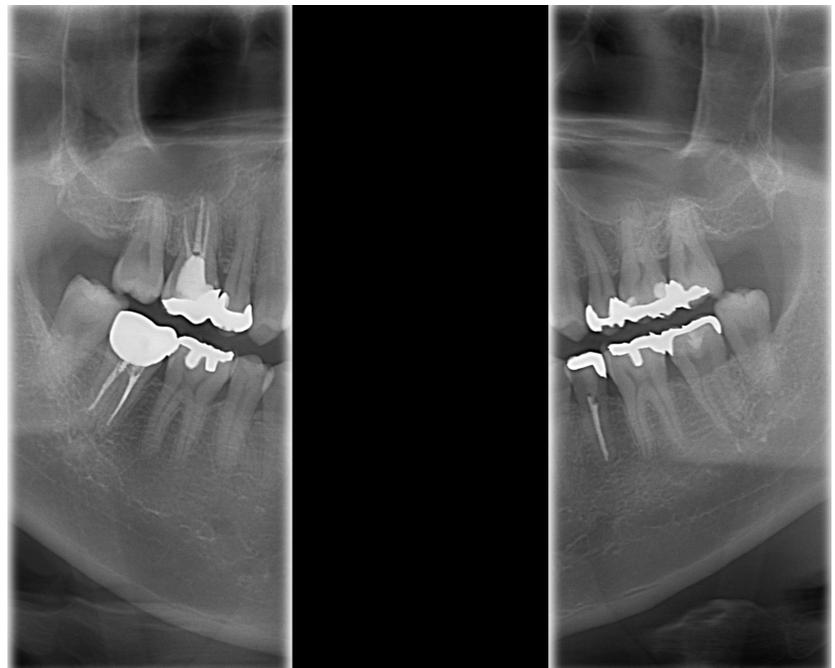

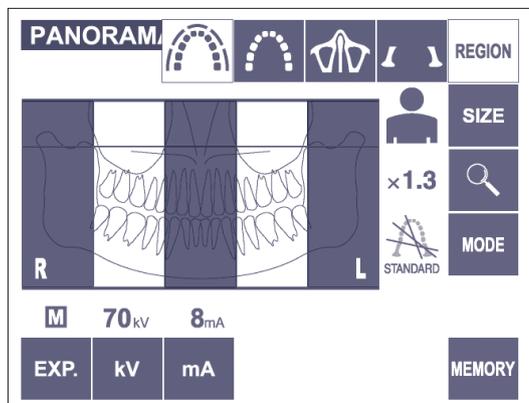

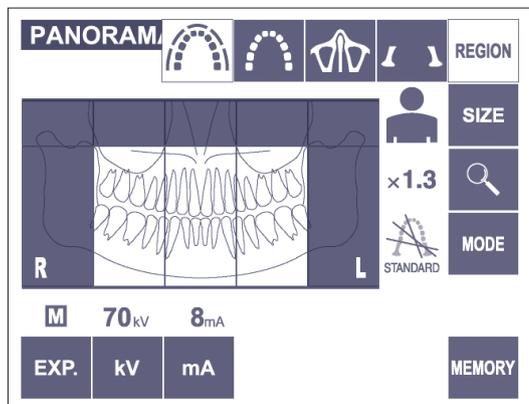

Adjusted Focal Plane  
Three point adjustment – the focal plane position of the apical region at the mandibular, maxilla, and occlusal plane can be adjusted independently.

# Partial Panoramic Function

When a full panoramic image is not required, 1 to 5 sections of the panoramic image, as well as the maxillary sinus, can be excluded to expose only those areas within the region of interest. By excluding parts of the dental arch, dose is reduced.

The partial panoramic function is easy to operate. Simply press the Partial Panorama key and the panoramic and maxillary sinus appear with equally divided sections. Select any to exclude them from the irradiation area.

# Veraviewepocs 3D R100

## A New Frontier in X-ray Diagnostics

Veraviewepocs 3D R100 has changed the shape of FOV. This unit's groundbreaking and patent pending 3D Reuleaux Full Arch FOV (field of view) provides a unique shape for full arch imaging. With 6 field of view options and Morita's world renowned image quality, Veraviewepocs 3D R100 is suitable for a wide variety of dental applications including implant planning.

# Specifications

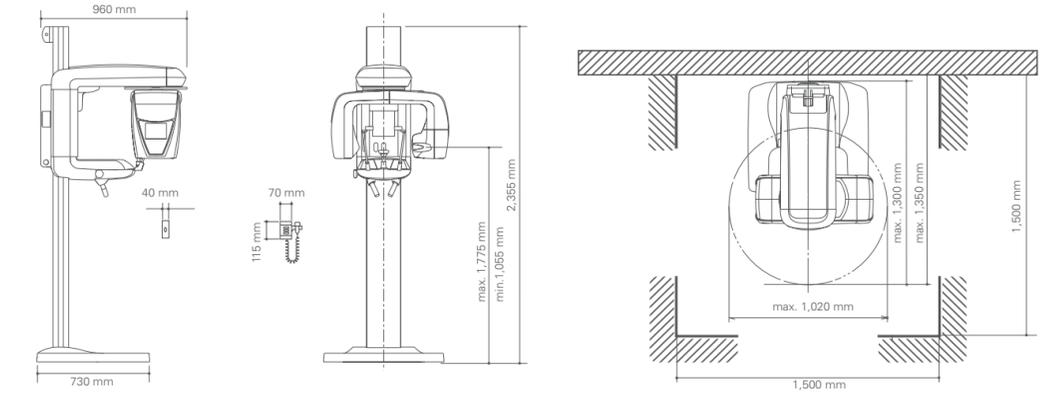

<b>Trade name:</b>	Veraviewepocs 3D
<b>Model:</b>	X550
<b>Type:</b>	EX-1, EX-2
<b>Unit configurations:</b> (EX-1, EX-2 available in all configurations)	Veraviewepocs 3D R100 Pan Veraviewepocs 3D R100 Pan/Ceph Veraviewepocs 3D F40 Pan Veraviewepocs 3D F40 Pan/Ceph
<b>Input voltage:</b>	EX-1: AC 120V 60 Hz EX-2: AC 220/230/240V 50/60 Hz
<b>Power consumption:</b>	2.3 kVA
<b>Dimensions</b>	
<b>Main unit:</b>	W 1,020 x D 1,300 x H 2,355 mm
<b>With Cephalometric:</b>	W 2,000 x D 1,300 x H 2,355 mm
<b>Weight:</b>	Approx. 190 kg Approx. 260 kg with Cephalometric
<b>X-ray generator</b>	
<b>Tube voltage:</b>	60-90kV (depending on exposure mode)
<b>Tube current:</b>	1-10mA (depending on exposure mode)
<b>Effective focal spot:</b>	0.5 mm
<b>3D image</b>	
<b>Exposure time:</b>	Approx. 9.4 seconds
<b>Tube voltage and current:</b>	Normal mode 1 - 10mA (1mA step) @ 75 - 80 kV (5kV step) 1 - 8mA (1mA step) @ 85 - 90 kV (5kV step)
	Dose reduction mode 3 - 10mA (1mA step) @ 75 - 80 kV (5kV step) 3 - 8mA (1mA step) @ 85 - 90 kV (5kV step)
